

A new drip irrigation system for the 3rd millennium.

The Solar-Dripper is an automatic solar irrigation system that optimizes watering by synchronizing the flow with water requirements.

1 -The Solar-Dripper flow rate follows the Evapotranspiration.

2- Watering is precisely directed to reduces evaporation.

3 -Solar-Dripper is Ultra Tolerant to Clogging (UTC > 2 mm). The unique regulator allows 2 mm particles and biofilms to pass. It is no longer necessary to install an expensive filtration system to benefit from precise drip irrigation.

Rainwater or gray water can be used directly and all types of fertilizer can be used.

The Solar-Dripper has been tested in France, Canada, Switzerland, Austria, Germany, Burkina Faso, USA and Madagascar.

The Water Saving is outstanding. It is perfect for urban agriculture.

We are looking for distributors and NGOs to implement this efficient irrigation system for the benefit of food security and reforestation.

The Solar-Dripper was awarded the Efficient Solution label by the SolarImpulse Foundation in June 2019.
